

External Condensation

1

It's the time of year where you might see condensation forming on the outside of your double or triple-glazed windows.

Don't worry it's completely normal, and just means your energy efficient windows are working as they should.

Liniar

2

Liniar windows keep the heat inside your home. This means the outer pane of glazing doesn't get warmed as the heat isn't transferred.

3

Not warming the outer pane means it can drop below the outdoor dew point temperature, causing condensation to form.
